

# Приложение 1 — 1.1. Связь программы на MSX BASIC с подпрограммами в машинных кодах

[\[92\]](#)

## USR

Passes a variable to a previously subroutine in machine language. The location of the subroutine has to be defined first, using the DEF USR instruction.

Syntax

USR[<number>](<variable>)

[edit] Parameters

<number> can range from 0 to 9. When omitted, 0 is assumed.

<variable> is a variable or a string can be retrieved by the machine subroutine.

[edit] Example

<https://www.msx.org/wiki/USR>
