

InterNestor Suite

Разработка InterNestor Suite прекращена.

Развитием этого решения является [InterNestor Lite](#).

InterNestor Suite is a TCP/IP plus PPP stack for MSX2/2+/TR computers with [MSX-DOS 2](#), at least 256K mapped RAM and RS232 interface. It allows internet connection through a modem and using any ISP access account, or direct connection to other computer using a null-modem cable. It installs as a TSR, so any application may use its routines for accessing the internet. InterNestor Suite consists on:

- Installer program, it installs the modules that compose the stack.
- Four code modules: physical module (RS232), link level module (PPP), network level module (IP) and transport level module (TCP).
- Modem dialer for connections via modem+ISP.
- PPP connection and TCP connections control programs.
- Four simple applications: a PING client, a resolver (name server access client, for example to convert site names to IP addresses), a simple telnet client, and a complete FTP client.
- User's and programmer's manual, in english. This manual explains how to install and use InterNestor Suite, and provides all the necessary information for developing internet based applications.

Note: InterNestor Suite requires NestorMan to work.

Downloads for InterNestor Suite: [INS-V10.LZH](#): InterNestor Suite 1.0 , with all the components mentioned above plus the Erik Maas' Fossil driver for RS232, needed by the stack to work.
